Comprehensive Reconstructive and Surgical Interventions for TMD and Obstructive Sleep Apnea

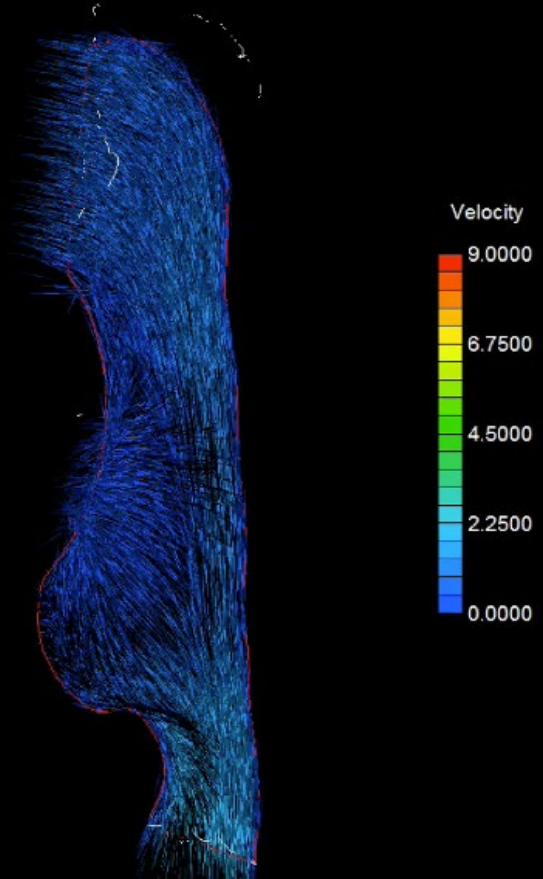

Save the Date for this Continuing Education Event.

Only a small percentage of patients will require minimally invasive or invasive surgical intervention. Once all non-surgical paths are exhausted, the Sleep and TMD practitioner should have the general understanding of when it is time to lead their patient into this next phase. Also, the adequate understanding of surgical intervention by the referring practitioner allows for improved patient acceptance and ease into the continuation of therapy.

In this course, the indications for diagnostic and palliative procedures, such as DISE, arthrocentesis, and arthroscopy, will be discussed. Procedures that will aid in improvement of airway and bite correction will be elaborated – including MSE, surgically assisted MSE, EASE, and distraction osteogenesis.

Our experience with maxillomandibular advancement and related literature will be reviewed. The role that TMJ intervention requires for these patients will also be highlighted through numerous case studies.

For More Information, please call 314-878-6725

Dr. Reza Movahed
Oral and Maxillofacial Surgeon

Dr. Dipesh Sitaram
DDS, MICCMO, FICCMO, OCF

Dr. Daniel Klauer
DDS, CDSM, DSM, AACP, AADSM

Dr. Douglas Liepert
MD, Otolaryngology

Robert Murdocco
RPT, CFC, Physical Therapy

Dr. Jason Cox
MD, Radiologist
